

Meta-Tuning LLMs to Elicit Lexical Knowledge of Language Style

Ruohao Guo, Wei Xu, Alan Ritter

1. Introduction

Style Identification: The style of a text refers to unique ways authors select words and grammar to express their message. It can provide insights into social interactions and implicit communication.

Challenges:

- The open-ended and ever-evolving nature of style motivates the need for zero-shot learning.
- (2) Zero-shot style classification remains a challenge for standard LLM prompting.
- (3) The ambiguity of style in language

sarcastic

often poses a challenge for classification efforts.

Speaker A: I'm worried I might lose my job in these company cutbacks. Speaker B: Well, no point in worrying until it happens, right?

---> unhelpful

2. Contributions

- Introduce lexicon-based instructions, a simple yet effective method for zero-shot style classification leveraging lexical knowledge in LLMs.
- Show class randomization can improve generalization capability of lexicon-instructed models significantly
- Provide a **benchmark**, featuring 13 established tasks and a synthetic dataset of 63 new tasks

5. Zero-Shot Learning

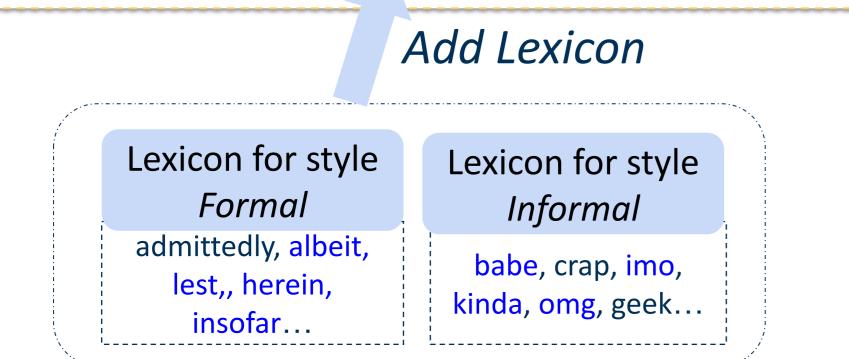

3. Lexicon-Based Instruction

Method

Instruction: The task is to classify a sentence as "formal" if the style of the sentence is similar to the words "albeit, lest, herein, insofar" or as "informal" if the style... words "babe, imo, kinda, omg". Here is the sentence: "I think she is unvirtuous."

On 6 established datasets

| Model | Meta-Tuned? | Instruction | Shakespeare | Romance | Humor | Country | Sarcasm | Age | Avg. |
|--------------------------|--------------|-------------|-------------|---------|-------|---------|---------|-------|-------|
| Flan-T5 _{base} | × | Standard | 33.36 | 33.33 | 33.33 | 43.15 | 33.33 | 33.92 | 35.07 |
| | X | + Lex | 49.95 | 51.30 | 48.66 | 35.34 | 49.40 | 49.02 | 47.28 |
| Style-T5 _{base} | \checkmark | Standard | 33.31 | 43.57 | 36.43 | 19.86 | 33.37 | 35.75 | 33.72 |
| | √ | + Lex | 55.10 | 78.98 | 60.56 | 49.09 | 49.25 | 50.80 | 57.30 |
| Style-GPT-J | \checkmark | Standard | 58.16 | 87.82 | 33.33 | 53.11 | 44.10 | 35.25 | 51.96 |
| | √ | + Lex | 56.76 | 83.99 | 55.86 | 44.97 | 48.84 | 47.47 | 56.32 |
| LLaMA-2-Chat (7B) | × | Standard | 60.20 | 85.72 | 43.84 | 49.19 | 36.02 | 38.91 | 52.31 |
| | × | + Lex | 62.59 | 88.95 | 51.01 | 50.88 | 42.88 | 36.54 | 55.47 |
| LLaMA-2-Chat (13B) | X | Standard | 61.99 | 97.00 | 47.42 | 17.96 | 43.26 | 48.16 | 52.63 |
| | × | + Lex | 63.49 | 95.00 | 55.15 | 24.41 | 44.66 | 53.88 | 56.10 |
| LLaMA-2 (7B) | × | Standard | 42.13 | 64.41 | 37.38 | 48.27 | 48.84 | 37.13 | 46.36 |
| | × | + Lex | 50.21 | 77.86 | 45.44 | 49.86 | 47.72 | 47.63 | 53.12 |
| Style-LLaMA (7B) | \checkmark | Standard | 40.91 | 41.65 | 48.88 | 48.92 | 49.02 | 49.80 | 46.53 |
| | \checkmark | + Lex | 59.03 | 88.97 | 57.64 | 51.52 | 50.83 | 50.53 | 59.75 |

Key idea: Meta-tune the model on training styles using lexicon-based instructions.

4. Class Randomization

Method

Instruction: The task is to classify a sentence

On 20 synthetic tasks

| | Standard | + Lex | |
|--------------------|----------|-------|--|
| Random Baseline | 36.65 | | |
| LLaMA-2-Chat (7B) | 53.09 | 56.23 | |
| Style-LLaMA (7B) | 46.25 | 58.71 | |
| Style-LLaMA+ (7B) | 65.46 | 74.31 | |
| LLaMA-2-Chat (13B) | 56.80 | 59.75 | |
| | | | |

- Lexicon-based instructions outperform standard instructions.
- Meta-tuning on style data with lexicons enhances the zero-shot performance compared to general instruction tuning.

Goal: Improve the instruction-tuned models' ability to generalize to unseen styles.

as "southnlp" if the style of the sentence is similar to the words "albeit, lest, herein, insofar" or as "Atlanta" if the style... words "babe, imo, kinda, omg". Here is the sentence: "I think she is unvirtuous."

• Key idea:

 Replace meaningful style labels with randomly selected identifiers, in order to prevent models from memorizing training styles.

• Encourage the model to generalize to interpret lexicons for new styles.
